

Lecture 1.4 – Intro to R and RStudio

Specific Learning Objectives:

1.1.1 – Understand how to use the command line.

1.1.2 – Understand how to use the help function of R.

1.1.3 – Understand the basic syntax of the R language.

1.1.4 – Execute inbuilt mathematical functions to perform calculations in R.

1.1.5 – Learn how to assign variables.

1.1.6 – Understand the basic syntax of functions in R.

1.1.7 – Open, edit, and save a script in RStudio's editor.

2.2.1 – Create reproducible scripts in R.

Downloading *R* and RStudio

Download *R*:
<https://www.r-project.org/>

1. Go to <https://cloud.r-project.org/>
2. Select your operating system.
3. Select the latest release that is “notarized and signed.”
4. Save and open the file, follow the instructions to install.

Download RStudio:
<https://rstudio.com/products/rstudio/download/>

1. Select the RStudio Desktop version.
2. Download, open, and follow instructions to install.
3. Open RStudio to get started!

Check Your Understanding

Have R calculate the square root of 164956 using the `sqrt()` function.
What is the correct output?

Correct answer

a) `[1] 406.1478`

b) `[1] 12.8841`

c) **Error: unexpected input in " $\sqrt{}$ "**

d) **Error in `sqrt(164956, 2)` : 2 arguments passed to 'sqrt' which requires 1**

Error in c: I used the sign $\sqrt{164956}$, even though I understand what this means, R doesn't understand so returns an error.

Error in d: I put too many numbers (or arguments) in the `sqrt()` function so it's telling you you need one argument only!

Check Your Understanding

Syntax is important here! Using a space between the < and - will change the meaning of the command.

Try these: do they all have the same result? Why or why not?

a) `x<-2`

b) `x <- 2`

c) `x< - 2`

Does it matter which way the arrow points?

Try these: which work and which produce errors?

d) `7 -> j`

b) `7 <- j`

c) `j -> 7`

Functions in R

Check your understanding!

What happens if you enter the numbers into mean without the **c()**? Or like this:

```
> mean(1, 9, 8, 2)
```

Why does it do this?

Why would the mean not calculate correctly based on the help documentation for **mean()**?

About R assignments

- You will be turning in assignments in R as R scripts

- Scripts must have the extension “.R”
- Please include the assignment number in the script name
- Include your name, course number, section number, date, and assignment number as a comment at the top of the script.
- For each question, please start the answer with a comment:

```
# question a:  
answer code
```
- Any written text should be included as a comment in the script.

- How your scripts will be scored:

- Grader will download your script and hit “source” on top, then evaluate output based on the assignment question.
- If there is an error on source, it will be scored 0 (unless that’s part of the assignment!) Please CHECK FIRST that it will run by starting a new R session and then sourcing your script!

For the rest of the class...

- **In-class exercises:**

1. Write a short explanation about how to install a package using:
 - a) RStudio's GUI package manager
 - b) command line in R
2. Exercise 2.2 in Davies (End of Chapter 2 section 2, page 22).

- **Then, start on Assignment 1.5**

Action Items

- 1. Complete Assignment 1.5**
- 2. Read Davies Chapter 4 for next time.**
